

These are pages 18 - 19. The rest of the chapter is more Chemistry based – reactions, but the physics aspects of them.

EMAIL ME if you have questions.

# Nuclear Physics

- **Nuclide:** a particular type of nucleus
- **Nucleon:** a proton or a neutron
- **Atomic number ( $Z$ ) (proton number):** number of protons in nucleus
- **Mass number ( $A$ ) (nucleon number):** number of protons + neutrons
- **Neutron number ( $N$ ):** number of neutrons in nucleus ( $N = A - Z$ )
- **Isotopes:** nuclei with same number of protons but different numbers of neutrons
- **Unified atomic mass unit ( $u$ ):**  $1/12^{\text{th}}$  the mass of a carbon-12 nucleus
- **Atomic mass  $\approx A * u$**

# Nuclear Physics

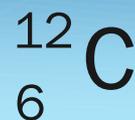

$$1 \text{ u} = 1.66 \times 10^{-27} \text{ kg}$$

$$1 \text{ u} = 1 \text{ g/mol}$$

$$1 \text{ u} = 931 \text{ MeV}/c^2$$

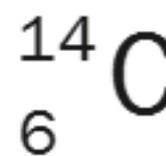

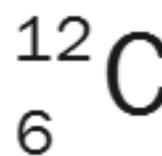

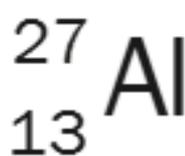

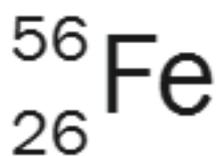

# Nuclear Physics

Atomic Number				
Mass Number				
Neutron Number				
Atomic Mass				
Molar Mass				

# Nuclear Physics

Atomic Number	26	13	6	6
Mass Number	56	27	12	14
Neutron Number	30	14	6	8
Atomic Mass	56 u	27 u	12 u	14 u
Molar Mass	56 g	27 g	12 g	14 g

# Interactions in the Nucleus

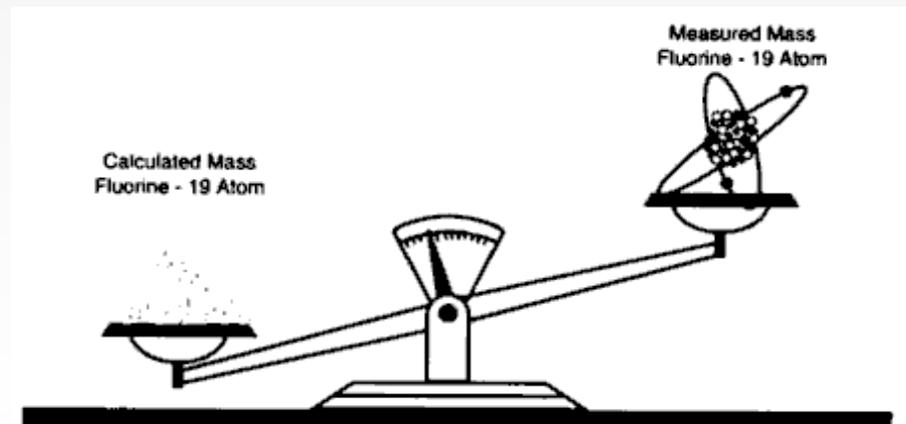

- **Gravitational:** (long range) attractive but very weak/negligible
- **Coulomb or Electromagnetic:** (long range) repulsive and very strong between protons
- **Strong nuclear force:** (short range) attractive and strongest – between any two nucleons
- **Weak nuclear force:** (short range) involved in radioactive decay

We covered this last year – the mass of the whole nucleus is less than the sum of the parts

## Binding Energy

- Mass defect (mass deficit) ( $\Delta m$ )
- Difference between the mass of the nucleus and the sum of the masses of its individual nucleons

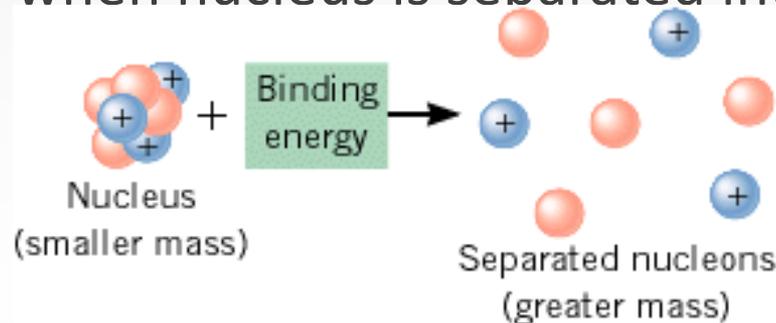

The missing mass converts to energy which binds the nucleus

## Binding Energy

- Nuclear binding energy ( $\Delta E$ )
- energy released when a nuclide is assembled from its individual components
- energy required when nucleus is separated into its individual components

These equations help us find the missing mass, or the amount of energy.

## Binding Energy

$$m_{\text{nucleus}} + Dm = m_{\text{nucleons}}$$

$$Dm = DE$$

$$E = mc^2$$

protons  $2 \times 1.00728 \text{ u}$

neutrons  $2 \times 1.00866 \text{ u}$

Alpha particle

Mass of parts

4.03188 u

Mass of alpha

4.00153 u

$$1 \text{ u} = 1.66054 \times 10^{-27} \text{ kg} = 931.494 \text{ MeV}/c^2$$

Last year to said mass defect = mass of nucleons minus the mass of the nucleus. Here they add mass nucleus to other side

# Binding Energy

$$m_{\text{nucleus}} + \Delta m = m_{\text{nucleons}}$$

protons  $2 \times 1.00728 \text{ u}$

neutrons  $2 \times 1.00866 \text{ u}$

Alpha particle

Mass of parts

4.03188 u

Mass of alpha

4.00153 u

$$1 \text{ u} = 1.66054 \times 10^{-27} \text{ kg} = 931.494 \text{ MeV}/c^2$$

# Binding energy IS mass defect

## Binding Energy

$$Dm = DE$$

protons  $2 \times 1.00728 \text{ u}$

neutrons  $2 \times 1.00866 \text{ u}$

Alpha particle

Mass of parts

4.03188 u

Mass of alpha

4.00153 u

$$1 \text{ u} = 1.66054 \times 10^{-27} \text{ kg} = 931.494 \text{ MeV}/c^2$$

Why Einstein is famous – matter and energy are interchangeable.

## Binding Energy

	protons	$2 \times 1.00728 \text{ u}$		Alpha particle
	neutrons	$2 \times 1.00866 \text{ u}$		
	Mass of parts	<u>4.03188 u</u>	Mass of alpha	4.00153 u

$$E = mc^2$$

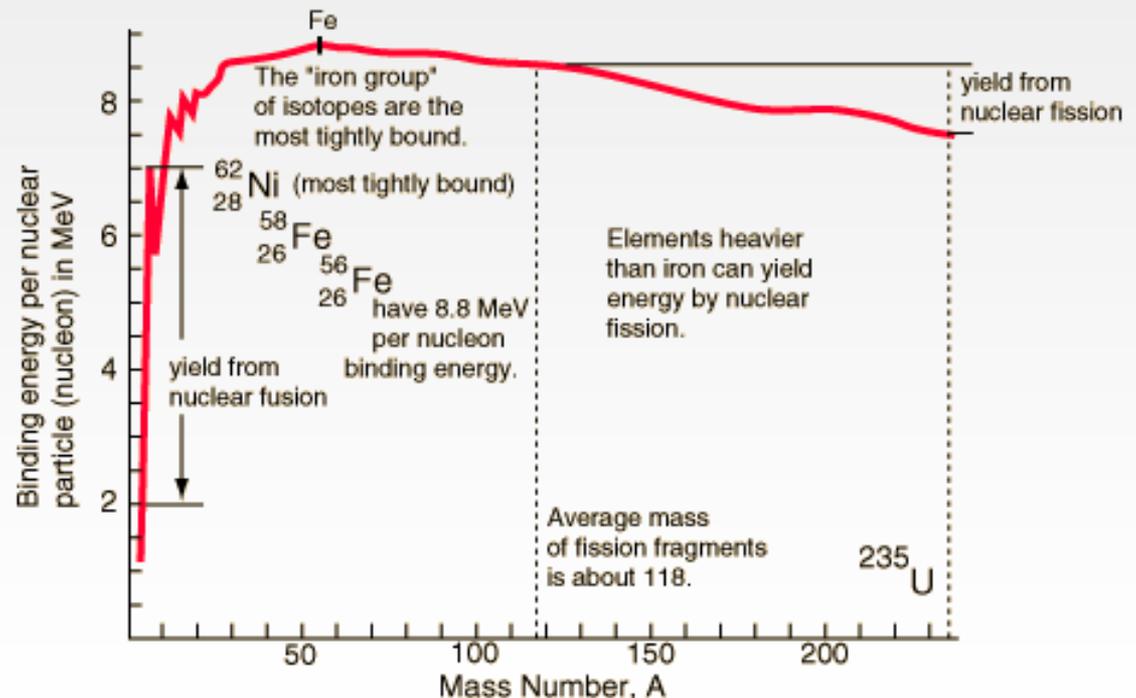

$$1 \text{ u} = 1.66054 \times 10^{-27} \text{ kg} = 931.494 \text{ MeV}/c^2$$

# Binding Energy

- Different nuclei have different total binding energies. As a general trend, as the atomic number increases . . .

**The total binding energy for the nucleus increases**

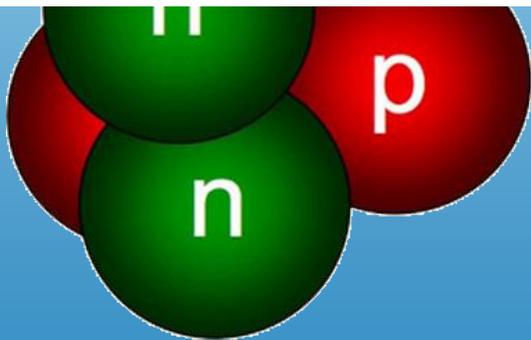

The most abundant isotope of helium has a  ${}^4_2\text{He}$  nucleus whose mass is  $6.6447 \times 10^{-27}$  kg. For this nucleus, find the mass defect and the binding energy.

Step 1 = mass defect

Step 2 = Energy calculation

When mass is in kg use  $E = mc^2$ .

When mass is in u use  $1 \text{ u} = 931 \text{ MeV}$ .

The most abundant isotope of helium has a  ${}^4_2\text{He}$  nucleus whose mass is  $6.6447 \times 10^{-27}$  kg. For this nucleus, find the mass defect and the binding energy.

$$\Delta m = m_{\text{nucleons}} - m_{\text{nucleus}}$$

$$\Delta m = 2(1.673 \times 10^{-27} \text{ kg}) + 2(1.675 \times 10^{-27} \text{ kg}) - 6.6447 \times 10^{-27} \text{ kg}$$

$$\Delta m = 0.0513 \times 10^{-27} \text{ kg} = 5.13 \times 10^{-29} \text{ kg}$$

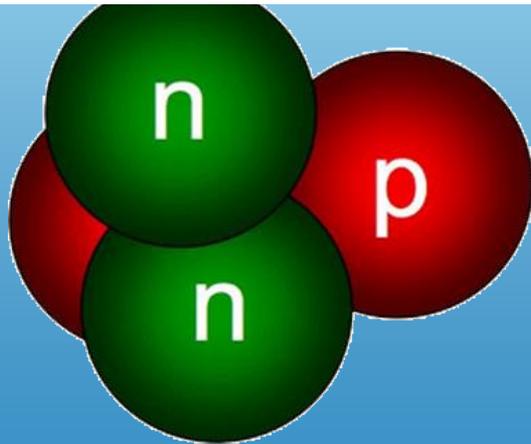

$$E = (\Delta m)c^2$$

$$E = (5.13 \times 10^{-29} \text{ kg})(3.00 \times 10^8 \frac{\text{m}}{\text{s}})^2$$

$$E = 4.62 \times 10^{-12} \text{ J}$$

$m$  in kg needs to use  $E=mc^2$

Do not use  $u$  when using  $E = mc^2$

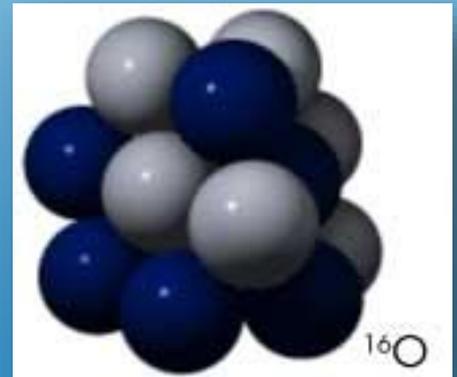

Calculate the binding energy and mass defect for  ${}^8_{16}\text{O}$  whose measured mass is 15.994915 u.

Step 1 = mass defect

Step 2 = Energy calculation

When mass is in kg use  $E = mc^2$ .

When mass is in u use  $1 \text{ u} = 931 \text{ MeV}$ .

Calculate the binding energy and mass defect for  ${}^8_{16}\text{O}$  whose measured mass is 15.994915 u.

$$\Delta m = m_{\text{nucleons}} - m_{\text{nucleus}}$$

$$\Delta m = 8(1.007276 \text{ u}) + 8(1.008665 \text{ u}) - 15.994915 \text{ u}$$

$$\Delta m = 0.132613 \text{ u}$$

m in u needs to use  $1 \text{ u} = 931 \text{ MeV}$

$$\Delta E = \Delta m = 0.132613 \text{ u} \left( \frac{931 \text{ MeV}/c^2}{1 \text{ u}} \right) = 123.5 \text{ MeV}$$
