## Momentum Review

Directions: Solve the following problems using the GUESS method and proper significant figures. Be sure to show ALL work.

1. A mass having a momentum of $16.2 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s}$ north receives an impulse of $15.3 \mathrm{~N} \cdot \mathrm{~s}$ in the direction of motion. The final momentum of the mass is?

$$
\begin{aligned}
& J=p_{f}-p_{i} \\
& p_{f}=J+p_{i}=(15.3 \mathrm{~N} \cdot \mathrm{~s})+\left(16.2 \frac{\mathrm{~kg} \cdot \mathrm{~m}}{\mathrm{~s}}\right)=31.5 \frac{\mathrm{~kg} \cdot \mathrm{~m}}{\mathrm{~s}} \text { north }
\end{aligned}
$$

2. A force of 110 N acts forward for 0.55 seconds on a 1.2 kg baseball.
a. What is the change in momentum of the ball?

$$
\Delta \mathrm{p}=\mathrm{Ft}=(110 \mathrm{~N})(0.55 \mathrm{~s})=61 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s} \text { forward }
$$

b. What is the impulse given to the ball?

$$
\mathrm{J}=\Delta \mathrm{p}=61 \mathrm{~N} \cdot \mathrm{~s} \text { forward }
$$

c. What will its final velocity be (assuming it started at rest)?

$$
\begin{aligned}
& \mathrm{m} \Delta \mathrm{v}=\mathrm{J} \\
& \Delta \mathrm{v}=\frac{\mathrm{J}}{\mathrm{~m}}=\frac{61 \mathrm{~N} \cdot \mathrm{~s}}{1.2 \mathrm{~kg}}=51 \mathrm{~m} / \mathrm{s} \text { forward }
\end{aligned}
$$

d. What is the ball's acceleration?

$$
a=\frac{F}{m}=\frac{+110 \mathrm{~N}}{1.2 \mathrm{~kg}}=92 \mathrm{~m} / \mathrm{s}^{2} \text { forward OR } \quad a=\frac{\Delta v}{t}=\frac{51 \mathrm{~m} / \mathrm{s}}{.55 \mathrm{~s}}=93 \mathrm{~m} / \mathrm{s}^{2} \text { forward }
$$

The difference in accelerations is okay - it is the result of rounding and significant figures
3. During the Collisions and Explosions lab, the red car (of mass 2.0 kg ) is traveling at $3.0 \mathrm{~m} / \mathrm{s}$ south. The blue car is traveling north at $1.5 \mathrm{~m} / \mathrm{s}$ and has a momentum of $6.0 \mathrm{~kg}-\mathrm{m} / \mathrm{s}$. When the cars collide their Velcro locks them together.
a. What is the momentum of the red car before the collision?

$$
p=m v=(2.0 \mathrm{~kg})\left(-3.0 \frac{\mathrm{~m}}{\mathrm{~s}}\right)=6.0 \frac{\mathrm{~kg} \cdot \mathrm{~m}}{\mathrm{~s}} \text { south }
$$

b. What is the mass of the blue car before the collision?

$$
m=\frac{p}{v}=\frac{6.0 \frac{\mathrm{~kg} \cdot \mathrm{~m}}{\mathrm{~s}}}{1.5 \frac{\mathrm{~m}}{\mathrm{~s}}}=4.0 \mathrm{~kg}
$$

c. What is the speed of the two cars after the collision?

| Before |  |
| ---: | :--- |
| $P_{\text {before }}$ | $=$ |
| $\mathrm{p}_{1}+\mathrm{p}_{2}$ | $=$ |
| $6.0 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s}+(-6.0 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s})$ | $=$After <br> $0 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s}$ |
| 0 |  |
| $0 \mathrm{~m} / \mathrm{s}$ | $=$ |

4. Later, during the Collisions and Explosions lab, the cars are placed together in the center of the track. The compressed spring is released, sending the red car (of mass 0.85 kg ) to the West with a velocity $1.6 \mathrm{~m} / \mathrm{s}$. What is the velocity of the blue car (of mass 3.17 kg ) after the explosion?

| Pbefore $=$ |
| ---: |
| $P_{\text {before }}=$ |
| $0 \mathrm{~kg}-\mathrm{m} / \mathrm{s}=$ |
| $1.36 \mathrm{~kg}-\mathrm{m} / \mathrm{s}=$ |
| $0.43 \mathrm{~m} / \mathrm{s}$ East $=$ |

$$
\begin{aligned}
& \text { Pafter } \\
& m_{1} v_{1}+m_{2} v_{2} \\
& (0.85 \mathrm{~kg})(-1.6 \mathrm{~m} / \mathrm{s})+(3.17 \mathrm{~kg})\left(\mathrm{v}_{2}\right) \\
& (3.17 \mathrm{~kg})\left(\mathrm{v}_{2}\right) \\
& \mathrm{v}_{2}
\end{aligned}
$$

5. Even later, during the Collisions and Explosions lab, the red car (of mass 0.85 kg ) is traveling to the right with a speed of $1.28 \mathrm{~m} / \mathrm{s}$. It is hit from behind by the blue car (of mass 3.17 kg ), which is also moving to the right with a speed of $3.92 \mathrm{~m} / \mathrm{s}$. After they collide the red car continues to move to the right, but now at $4.18 \mathrm{~m} / \mathrm{s}$. What is the velocity with which the blue car continues to move after the collision?

| Pbefore $=$ |
| ---: |
| $\mathrm{m}_{1} \mathrm{~V}_{1}+\mathrm{m}_{2} \mathrm{~V}_{2}=$ |
| $(0.85 \mathrm{~kg})(+1.28 \mathrm{~m} / \mathrm{s})+(3.17 \mathrm{~kg})(+3.92 \mathrm{~m} / \mathrm{s})$ |
| $+13.5144 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s}=$ |
| $3.1 \mathrm{~m} / \mathrm{s}$ right $=$ |

```
Pafter
m}\mp@subsup{\mp@code{l}}{1}{}+\mp@subsup{m}{2}{}\mp@subsup{v}{2}{}
(0.85 kg)(+4.18 m/s) + (3.17 kg)( v2) =
+3.553 kg•m/s + (3.17 kg)( v2)
V
```

6. During the Egg Drop lab, two containers are released from a height of 2.0 meters. Each container (with egg) has the same mass of 2.41 kg . Container A crumples on the bottom, stopping in 1.2 seconds, keeping the egg safe. Container $B$ compressed straws while stopping in 0.48 seconds, cracking the egg. Because they were dropped from the same height, they both hit the ground with an impact velocity of 6.3 $\mathrm{m} / \mathrm{s}$ down.
a. Calculate the change in momentum while stopping of Container A.

$$
\Delta p=m \Delta v=m\left(v_{f}-v_{i}\right)=(2.41 \mathrm{~kg})\left(0 \frac{\mathrm{~m}}{\mathrm{~s}}-\underset{4}{\left.\left(-6.3 \frac{\mathrm{~m}}{\mathrm{~s}}\right)\right)=15 \frac{\mathrm{~kg} \cdot \mathrm{~m}}{\mathrm{~s}} \text { up }}\right. \text {. }
$$

b. Calculate the change in momentum while stopping of Container B.

$$
\Delta p=m \Delta v=m\left(v_{f}-v_{i}\right)=(2.41 \mathrm{~kg})\left(0 \frac{\mathrm{~m}}{\mathrm{~s}}-\left(-6.3 \frac{\mathrm{~m}}{\mathrm{~s}}\right)\right)=15 \frac{\mathrm{~kg} \cdot \mathrm{~m}}{\mathrm{~s}} \text { up }
$$

c. What is the impulse applied to Container A while stopping?

$$
J=\Delta p=15 \mathrm{~N} \cdot \mathrm{~s} \text { up }
$$

d. What is the impulse applied to Container $B$ while stopping?

$$
\mathrm{J}=\Delta \mathrm{p}=15 \mathrm{~N} \cdot \mathrm{~s} \text { up }
$$

e. Calculate the force acting on the egg in Container A while stopping.

$$
F=\frac{J}{t}=\frac{15 \mathrm{~N} \cdot \mathrm{~s}}{1.2 \mathrm{~s}}=13 \mathrm{~N} \text { up }
$$

f. Calculate the force acting on the egg in Container $B$ while stopping.

$$
F=\frac{J}{t}=\frac{15 \mathrm{~N} \cdot \mathrm{~s}}{0.48 \mathrm{~s}}=31 \mathrm{~N} \text { up }
$$

g. Why did the egg in Container A survive?

The decreased force from the increased stopping time of the crumple zone
